

Custom Game Environment for Reinforcement Learning:

Sandeep Durga

This project aims to build an intelligent agent that learns to navigate and perform tasks in a custom-designed game environment, such as a GridWorld or Maze. The agent interacts with the environment by taking actions (e.g., move up, down, left, right) and receives rewards based on its performance, such as reaching a goal, collecting items, or avoiding obstacles.

Using **Reinforcement Learning (RL)** techniques like **Q-Learning** or **SARSA**, the agent learns an optimal policy to maximize cumulative rewards. The project demonstrates key RL concepts including **states**, **actions**, **rewards**, **policies**, and **exploration vs. exploitation**.
